Android is developed by a Developer Consortium known as Alliance to Portable Open and Sponsored commercially from Google. It was presented in November 2007, with the first Android commercial device, the HTC dream, launched in September 2008. It is free and open source software: The source code is known as Android Open Source Project (Ason), which is mainly licensed under the Apache license. However, most Android devices are sent with additional pre-installed software, [12] in particular Google mobile services (GMS) [13] which includes the main apps like Google Chrome, the Google Play digital distribution platform and the Google Player development platform. About 70 percent of Android smartphones performs the Google ecosystem; Some with user interface customized by the Supplier and Software Suite, such as TouchWiz and subsequent a Samsung and HTC sense. [14] Android competitors' ecosystems and forks include Fire OS (developed by Amazon) or Linagoos. However, the name and the "Android" logo are Google business brands that impose standards to limit "non-certified" devices outside their ecosystem to use the Android brand [15] [16]. The source code was used to develop Android variants on a series of other electronics, as a game console, digital cameras, portable multimedia players, PCs and others, each with a specialized user interface.
