The new SEQUENT 24 PC programme is easier to use and completely separated from the 1.1 WHAT IS SEQUENT 24. The material difference distinguishing it from the other systems is that in the SEQUENT 24 this sensor is used ONLY DURING THE SELF-MAPPING. During the. The SEQUENT 24 harness is self-potential, programming will be car In particular, bear in mind that different than the previous systems' tried out with the vehicle running. Only the material difference ASSISTED PERSONALISED PROCEDURE has been introduced for SEQUENT 24. In these cases it is proper to avoid changing over in the most critical conditions that normally are idle speed or conditions requiring much torque to the engine. Apparently means LPG. If only the RED light is on it means that petrol is permanently manually selected. It grows out of the basis of Sequent Systems experience, but it is 27 Jan 2013 Showing recent items. Available for 3 and 4 cylinder vehicles, the kit was created with a view to preserve main characteristics of BRC gaseous injection systems, such as the significant gas ECU diagnostics feature. GP13 injectors are also included, meeting the latest generation engines requirements. <http://xn--z92bzy85x.com/userData/board/craftsman-manual-battery-charger.xml>

The 64pin OBD ECU was planned and developed on the basis of BRC automotive longstanding experience, giving a further technological goal to increase gas system performance in terms of both driveability and reliability. The 32pin gas ECU improves consumption and air pollutant emission, thanks to the self-adaptive function activation. Together with INO3 electroinjectors, developed by BRC to satisfy the stringent Car Manufacturers quality standards, it is the perfect conversion system for the latest generation vehicles. The gas is injected into the intake manifold while petrol is directly injected into the combustion chamber, allowing to benefit from the easy installation typical of Sequent systems and use the same mechanical parts. Main components include gas ECU with specific software for direct injection management and INO3 electroinjector that accurately manages the injection to increase the gas system performance in terms of both driveability and reliability. It is a crude refining product and a natural gas coming from the oilfields. It has a complex composition but it is mainly made up by propane and butane. All bifuel vehicles are 8,88% of national car fleet information provided by consorzio ecogas study centre With LPG systems, CO<sub>2</sub> carbon dioxide emissions are reduced by 10%. Save and reduce By way of example, a 60 l tank can effectively stock 48 l of LPG. Assuming to average 10 km to the LPG litre roughly equivalent to 12 km per petrol litre, the range should be at around 480 km. It is therefore important to compare consumptions all conditions being equal. Before moving to a foreign country, check if your refuelling point is the right one or buy the suitable adapter. Watch video For further information, download the app brc Ask anyway a brc installer for checking in details your engine and providing more specific information.

On average, the conversion takes a couple of days.<http://strandedtattoo.com/craftsman-manual-drill-press.xml>

The first one is usually installed into the spare wheel compartment inside or outside the vehicle so that luggage capacity is not affected. On the contrary, the cylindrical tank is usually installed into the car boot so that space for luggage is partially reduced according to the tank dimensions. Following the instructions indicated by the use and maintenance booklet of the system is suggested. In Italy, LPG tank must be replaced after 10 years from its final test. Reload to refresh your session. Apparently Subaru Italy has been offering these as a factory fit option called bifuel, but I'm not sure whether this is the case with my car. The UK LPG option wasn't made by BRC, incidentally, so no point trying to compare it to a UK model factory LPG equipped car. I located the gas filter and it's a F1J HE, but with one inlet and two outlet hoses not the typical F1J HE one finds on eBay. But since this car already has a MAP sensor, is it possible that the BRC ECU gets the MAP values from that or the Subaru ECU There's just a rubber plug.

<https://jdlwealth.com/images/90-240sx-factory-service-manual.pdf>

You have the orange injectors and I believe the Genius 1500 is your vapouriser, using coolant water to heat and vapourise the LPG. There is no separate MAF in this system. It purely connects into the car's own ECU and emulates the petrol injector signals. There will be one on the LPG tank itself and another under the bonnet. I assume you know what the colours of the lights etc mean on the switch. If only the RED light is on it means that petrol is permanently manually selected. If the RED light is on as well as some of the green tank level lights it means it's on petrol but it will automatically switch to LPG once the engine temperature comes up a bit. The car will ALWAYS start initially on petrol, regardless of the selection you make. The green lights below that are purely LPG level indicators. 4.3.2.1 then flashing 1. Wife's car, 1.6 Astra with BRC lpg. Seem to remember it is the sequent 24 or something like that. Don't trust those lights by the way, the contents indicating system is a bit limited. Otherwise been a really good system. Mine has a small vac hose running to it from the inlet manifold and is on a metal bracket. Similar to your picture below, that could be your one. Mine has a small vac hose running to it from the inlet manifold and is on a metal bracket. Similar to your picture below, that could be your one. I assume you know what the colours of the lights etc mean on the switch. If only the RED light is on it means that petrol is permanently manually selected. If the RED light is on as well as some of the green tank level lights it means it's on petrol but it will automatically switch to LPG once the engine temperature comes up a bit. Do they come on for a couple of seconds and then go off as in my video. Mine has a small vac hose running to it from the inlet manifold and is on a metal bracket. Similar to your picture below, that could be your one. The only nonstock hose I could find that connects to the inlet manifold is connected to the Genius vaporizer. I'll try to get a better look and make better photos tomorrow. I've looked at the BRC diagnostic interfaces in the past and I'm pretty sure most of them came with a software disc. Do they come on for a couple of seconds and then go off as in my video. Usually I've run out on the way I was going to get more anyway. It could be just that your tank is empty. When

the engine is warmed up and running with the RED light on and green lights off what happens when you try to switch to LPG. Does, it keep running. LPG injectors are quite noisy and it sounds a bit like a diesel when operating at idle. Usually Ive run out on the way I was going to get more anyway. The level should be one, maybe two LEDs. But when you turn the ignition ON do the three of 4 LEDs still come on for a few seconds before switching to displaying actual level I also measured the resistance and it was 90 Ohms. Does, it keep running. LPG injectors are quite noisy and it sounds a bit like a diesel when operating at idle. Maybe your design is only to display the level briefly when you first turn the ignition on. I would imagine that when your red light is on it is running on petrol and when off LPG. Try doing a drive with the red light off and see if the level decreases next time you switch the ign on. I know I get 5 miles per litre of LPG on my setup. Ill try to get a better look and make better photos tomorrow. This document should identify all the componets you need to know about. Occassionally my car will allow an overfull above 80% of the tank, maybe due to the angle of the car on filling or something.

If it does then the lights dont show as full until the level comes back down to the normal full level. Click download the brochure. Ta Maybe your design is only to display the level briefly when you first turn the ignition on. I would imagine that when your red light is on it is running on petrol and when off LPG. Try doing a drive with the red light off and see if the level decreases next time you switch the ign on. I know I get 5 miles per litre of LPG on my setup. How are these replaced as a whole unit or are there filter cartridges inside Now thats not good, is it I would take it for an LPG service and let them sort it for you. If you do try it on your own there is a manual shut off valve on the tank itself which screws closed. Ensure it is closed before undertaking any work but like I say, I wouldnt try dismantling it if you are unfamiliar. The gas is under high pressure and your electrical shut offs could be malfunctioning. Best left to the professionals! Its easy! Sign in here. You can adjust your Cookie Preferences at the bottom of this page. Reducer is sending with invoice. Please check your reducer on car before sending the order. If your LPG system is under warranty, you must replace reducer in legally autorised dealer. If your LPG system is out of warranty, you can use easily. Error!
